Trees and Communication

Assignment Project Exam Help

- Trees are everywhere: saplings, rivers, chemical compounds.
 - There is something about their efficiency and economy.

- Trees form a natural communication structure in distributed computing.

<https://powcoder.com>

Main Concepts on Trees

Assignment Project Exam Help

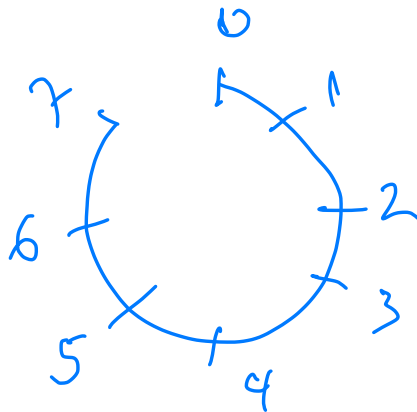

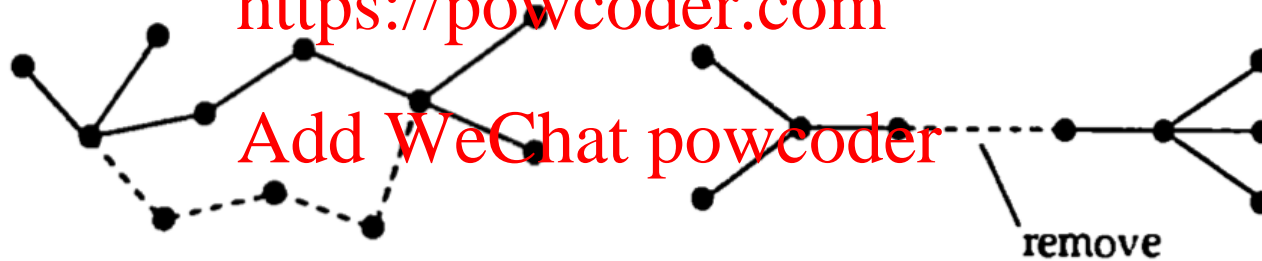

- A tree is a connected graph that has no cycles.
- Start with the tree of one vertex: we can build up any tree we wish by successively adding a new edge and a new vertex.
 - At each stage, the # of vertices exceeds the number of edges by 1, so every tree with n vertices has exactly $n - 1$ edges

Add WeChat powcoder

Characterization of Trees

Assignment Project Exam Help

- Let T be a graph with n vertices. Then the following statements are equivalent.

Add WeChat powcoder

- 
1. T is connected and has no cycles.
 2. T has $n - 1$ edges and has no cycles.
 3. T is connected and has $n - 1$ edges.
 4. T is connected and the removal of any edge disconnects T .
 5. Any two vertices of T are connected by exactly one path.
 6. T contains no cycles, but the addition of any new edge creates a cycle.

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Are equivalent

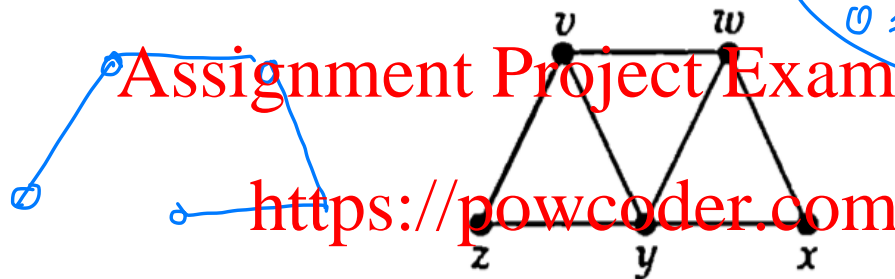

<https://powcoder.com>

Spanning Trees

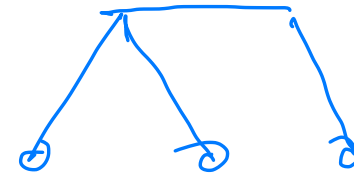

Assignment Project Exam Help

- Let G be a connected graph. Then a spanning tree in G is a subgraph of G that includes every vertex and is also a tree.

- A graph ...

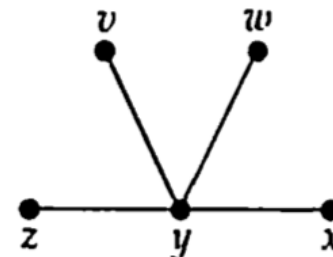

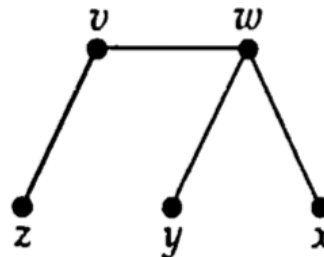

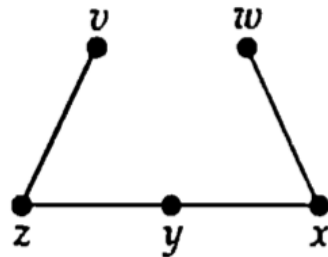

Count the number of spanning trees

Add WeChat powcoder

- ... and possible spanning trees

- Spanning trees emerge naturally in communication.

<https://powcoder.com>

Forests

Assignment Project Exam Help

- A Forest is a collection of vertex disjoint trees.

Add WeChat powcoder

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

The trees
of the forest
form connected
components.

- Forests arise naturally in clustering.
- A Spanning Forest is a collection of vertex disjoint spanning trees.

disjoint: T_1, T_2, \dots, T_k

Tree T_i has t_i vertices

$$\mathcal{F} = \{T_1, T_2, \dots, T_k\}$$

How many edges does the forest have?

$$\begin{aligned} n &= \# \text{ of vertices in the forest} \\ &= t_1 + t_2 + \dots + t_k \end{aligned}$$

$$t_1 - 1 + t_2 - 1 + \dots + t_k - 1 = n - k$$

Assignment Project Exam Help

Add WeChat powcoder

It builds knowledge about the graph.

The method is not limited
by any graph: it works in any
connected

graph. id

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

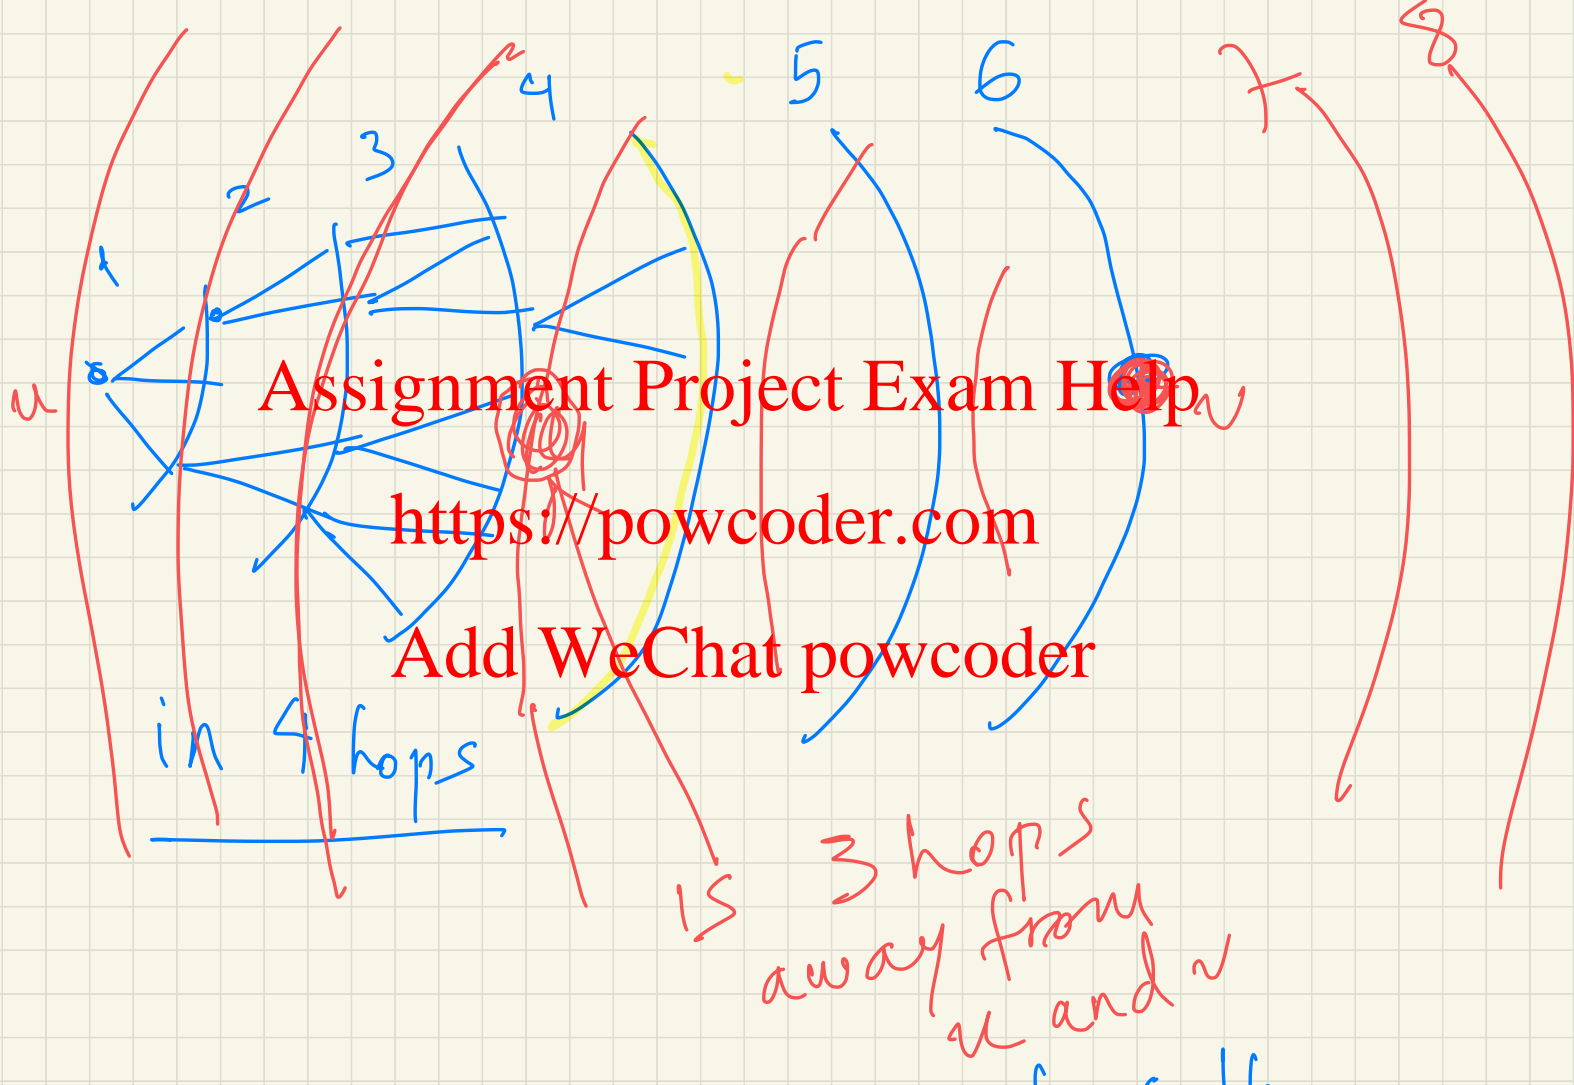

<https://powcoder.com>

Canonical Form

Assignment Project Exam Help

- Assume that initially, all nodes only know their own identifier and potentially some additional input.
- Information needs at least r rounds to travel r hops.
- After r rounds, a node v can only learn about other nodes at distance at most r .
- If message size and local computations are not restricted, it is in fact not hard to see, that
 - in r rounds, a node v can learn exactly all the node labels and inputs up to distance r from v .
- This allows us to transform every deterministic r -round synchronous algorithm into a simple canonical form.

[illegible][illegible][illegible]

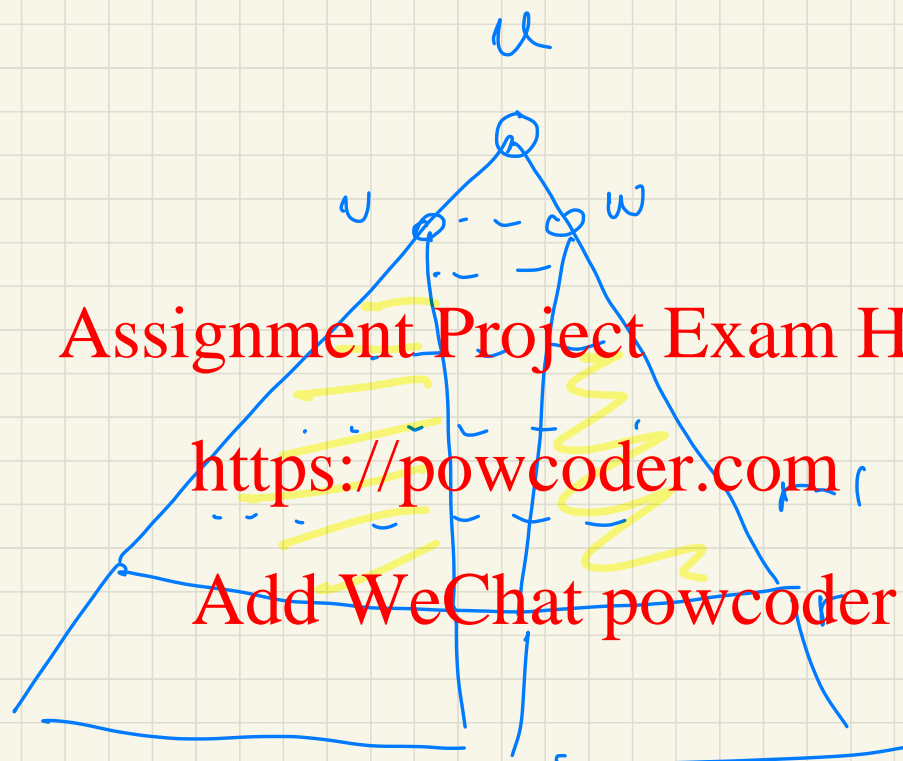

$$2^0 + 2^1 + 2^2 + \dots + 2^{r-1} + 2^r$$

↓

<https://powcoder.com>

Cumulative Messages

Assignment Project Exam Help

- The idea is to “simplify communication” with cumulative messages

Add WeChat powcoder

- A typical synchronous distributed algorithm at each node consists of a sequence of executions

Assignment Project Exam Help

send \rightarrow receive \rightarrow process

<https://powcoder.com>

in synchronous rounds.

Add WeChat powcoder

- Often what matters is the source and the destination.
- Can we first do a sequence of r executions “send \rightarrow receive” followed by a single “process” at the end?
- In other words, can we send “cumulative” messages for r rounds and finally do the processing?

<https://powcoder.com>

Example: Computing the Sum in a Ring

Assignment Project Exam Help

- Consider a ring of n nodes with identifiers ID_i and weights w_i at each node, for $i = 1, 2, \dots, n$.

Add WeChat powcoder

- In a typical distributed computation for a node i :
for r rounds do

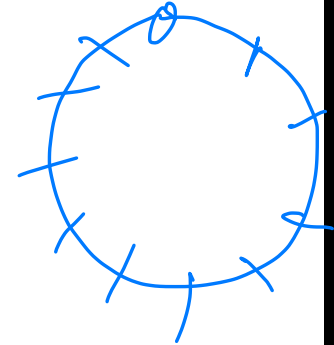

- i sends pair (ID_i, w_i) to $i + 1$, and receives pair (ID_{i-1}, w_{i-1}) from $i - 1$.
- process by adding $w_i + w_{i-1}$.

Assignment Project Exam Help

<https://powcoder.com>

- This can be done in a cumulative manner at i as follows:

- i sends $(ID_i, w_i), (ID_{i-1}, w_{i-1}), \dots, (ID_{i-1}, w_{i-r})$ to $i + 1$, receives $(ID_{i-1}, w_{i-1}), (ID_{i-2}, w_{i-2}), \dots, (ID_{i-r-1}, w_{i-r-1})$ from $i - 1$.
- process by adding $w_{i-1} + w_{i-2} + \dots + w_{i-r-1}$

<https://powcoder.com>

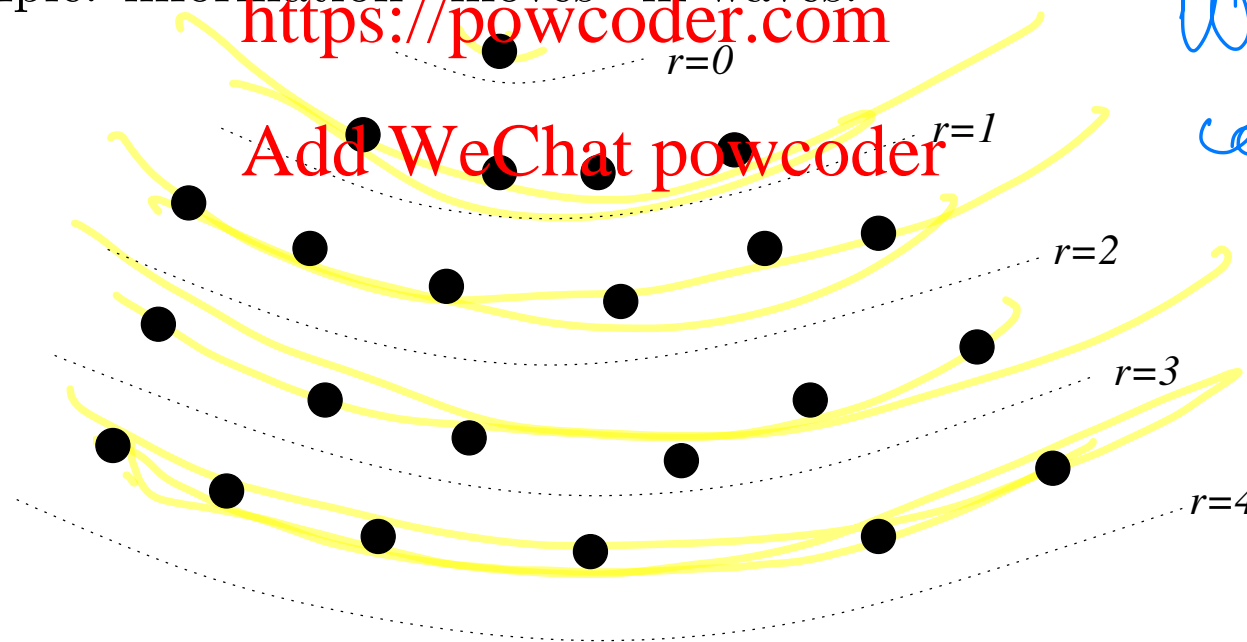

Synchronous Algorithm: Canonical Form

Assignment Project Exam Help

- Synchronous Algorithm Canonical Form**

1. In r rounds: send complete initial state to nodes at distance at most r /* all the communication first */
2. Compute output based on complete information about r -neighborhood /* do all the computation in the end */

- Example: information “moves” in waves!

We are only constrained by memory

<https://powcoder.com>

Main Claim on Canonical Form

Assignment Project Exam Help

- **Theorem 1** *If message size and local computations are not bounded, every deterministic, synchronous r -round algorithm can be transformed into an algorithm having the canonical form (i.e., it is possible to first communicate for r rounds and then do all the computations in the end).*

<https://powcoder.com>

- Notice the importance of being able to transmit messages of arbitrary size:

- this size will depend on the number of rounds, and
- it can be exponential in r

- To handle “large size messages” you need “large memory”

A message in a distributed system can be anything I want to be! Provided that I do not exceed memory requirements!

<https://powcoder.com>

Main Argument

Assignment Project Exam Help

- Consider an r -round algorithm \mathcal{A} . We want to show that \mathcal{A} can be brought to a canonical form.
- First, let the nodes communicate for r rounds.
- Assume that in every round, every node sends its complete state to all of its neighbors.
- By induction, after i rounds, every node knows the initial state of all other nodes at distance at most i .
- Hence, after r rounds, a node v has the combined initial knowledge of all the nodes in its r -neighborhood.
- We can show that this suffices to simulate locally (at node v) enough of Algorithm \mathcal{A} to compute all the messages that v receives in the r communication rounds of a regular execution of Algorithm \mathcal{A} .

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

<https://powcoder.com>

Issues

Assignment Project Exam Help

- It is straightforward to generalize the canonical form to randomized algorithms.
 - Every node first computes all the random bits it needs throughout the algorithm.

Assignment Project Exam Help

- The random bits are then part of the initial state of a node.

<https://powcoder.com>

In Canonical form of distributed computation we aggregate the messages into trees.

[Add WeChat powcoder](https://powcoder.com)

<https://powcoder.com>

Assignment Project Exam Help

Add WeChat powcoder

Assignment Project Exam Help

Distributed Views

Add WeChat powcoder

<https://powcoder.com>

Views: Undirected Networks

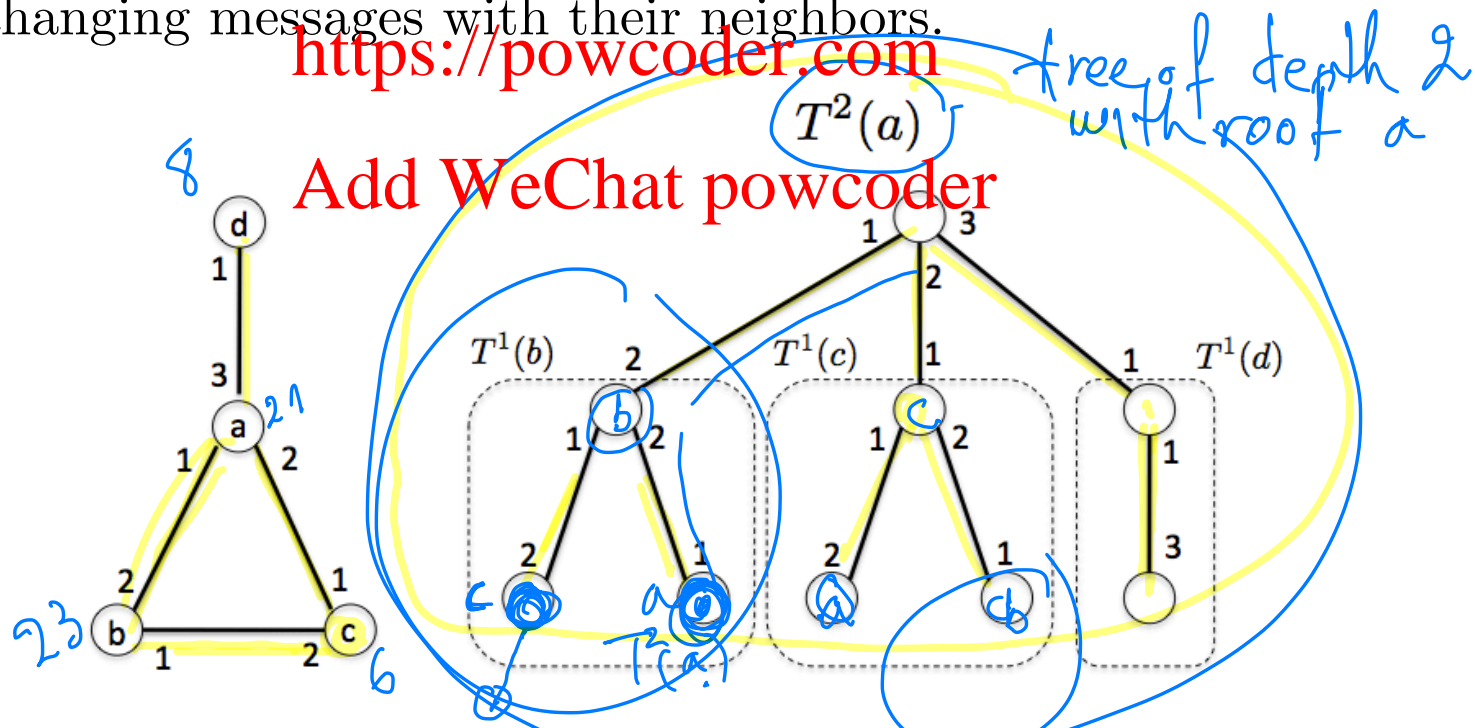

Assignment Project Exam Help

- Each node has port labels and can build a view accumulating its knowledge.
- The view of depth k of a node is a tree containing information on all the walks of length k leaving that node.
- Views contain all the information that nodes could obtain by exchanging messages with their neighbors.

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

<https://powcoder.com>

r -View (or r -Hop View or r -Neighborhood)

Assignment Project Exam Help

- Collection of initial states of all nodes in the r -neighborhood of a node v , is called r -hop view (or neighborhood) of v .
 - For a given graph G , it is denoted by

$V_r^G(v)$ or $N_r^G(v)$

Assignment Project Exam Help

- We usually omit mention of G (when clear from the context) and denote it by

$V_r(v)$ or $N_r(v)$.

Add WeChat powcoder

- A view can be enriched as needed by including information:
 - on node states,
 - node topology r hops away from the source v ,
 - etc

You can augment the View with any information you want.

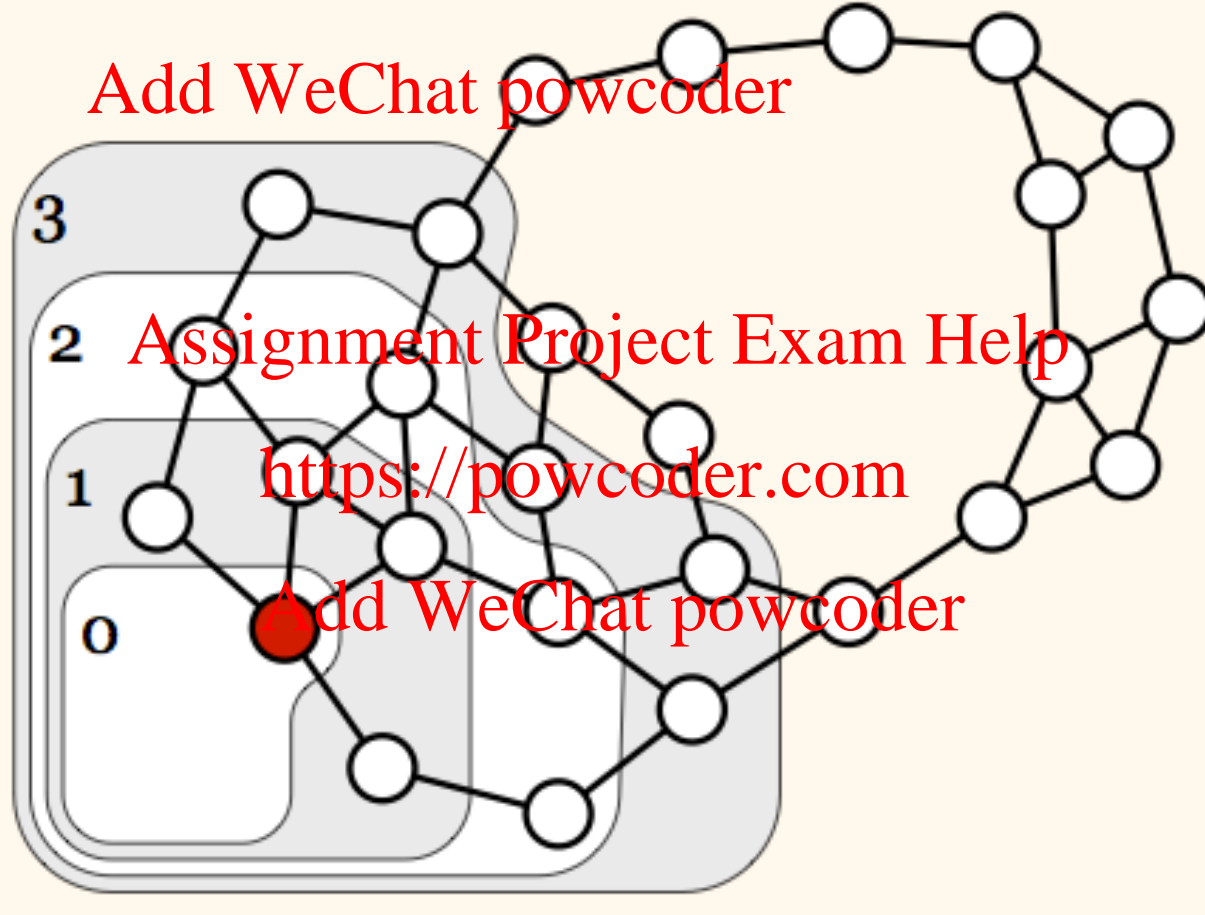

satan

<https://powcoder.com>

Example: r -Hop Views for $r = 0, 1, 2, 3$
 Assignment Project Exam Help

Add WeChat powcoder

2-Hop
 1-Hop
 0-Hop

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

<https://powcoder.com>

Issues

Assignment Project Exam Help

- Assume that initially, every node knows its degree, its label (identifier) and potentially some additional input.
- The r -hop view of a node v then includes
 - the complete topology of the r -neighborhood,
 - possibly edges between nodes at distance r in the subgraph, and
 - the labels and additional inputs of all nodes in the r -neighborhood.

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

<https://powcoder.com>

The View as a Function

Assignment Project Exam Help

- **Theorem 2** *A deterministic r -round algorithm A is a function that maps every possible r -hop view to the set of possible outputs.*
- By Theorem 1, we know that we can transform Algorithm A to the canonical form.
- After r communication rounds, every node v knows exactly its r -hop view.
- This information suffices to compute the output of node v .

Add WeChat powcoder

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

<https://powcoder.com>

Issues

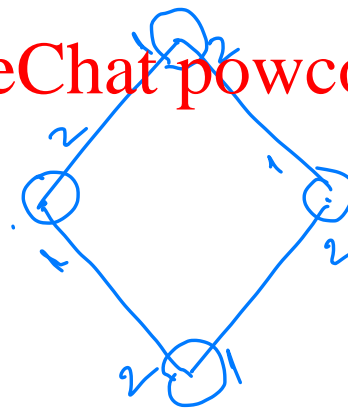

Assignment Project Exam Help

- Two nodes with equal r -hop views
 - have to compute the same output in every r -round algorithm.
- For coloring algorithms, the only input of a node v is its label.
 - The r -hop view of a node therefore is its labeled r -neighborhood.

Broadcasting

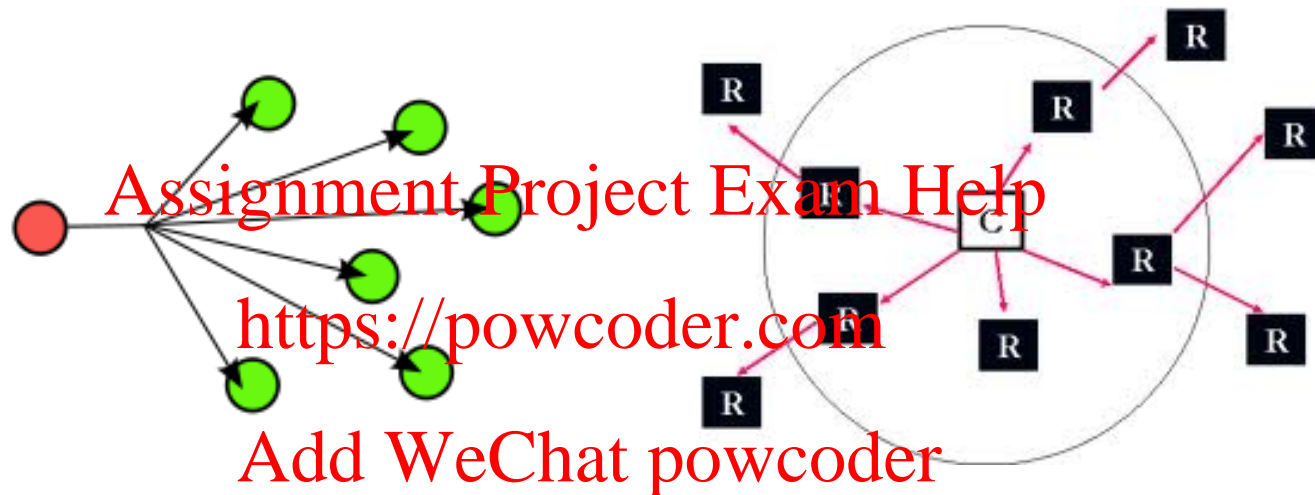

Add WeChat powcoder

<https://powcoder.com>

Broadcasting

Assignment Project Exam Help

- Broadcasting refers to a method of transferring a message to all recipients “at once” in a network.

- It is initiated by a single processor, the source.
- The source sends a message to all other nodes in the system.
- In a typical network it may not be possible to send a message “at once” since there might be multiple hops from the source to the rest of the nodes.

<https://powcoder.com>

Graph Concepts in Broadcasting

Assignment Project Exam Help

- The distance $d(u, v)$ between nodes u and v in an undirected graph G is the number of hops of a minimum length path between u and v .

Add WeChat powcoder

- The radius
 - of a node u is the maximum distance between u and any other node in the graph

Assignment Project Exam Help

<https://powcoder.com>

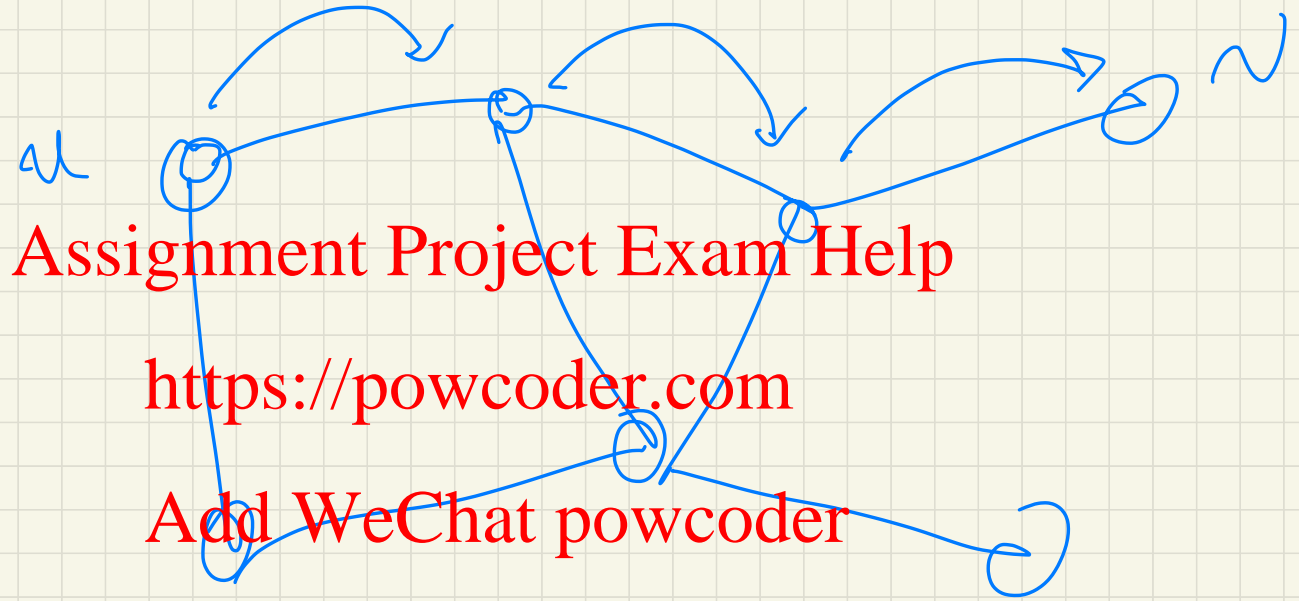

Add WeChat powcoder

$$R(u) = \max_v d(u, v)$$

- of a graph is the minimum radius of any node in the graph.

$$R = \min_u R(u)$$

- The radius and diameter of a graph are called graph eccentricities.

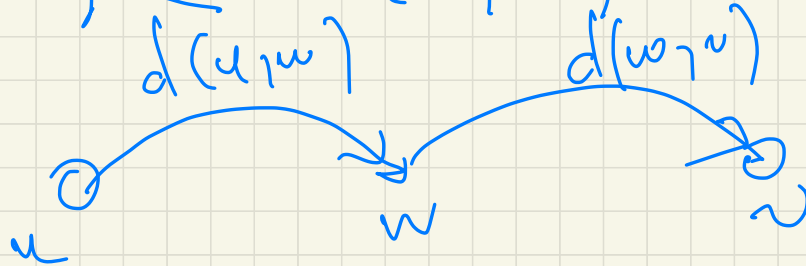

$d(u, v)$

$d_G(u, v) = \min \# \text{ of hops from } u \text{ to } v$

$d(u, v) = 0$ Assignment Project Exam Help

$d(u, v) = d(v, u)$ <https://powcoder.com>

$d(u, v) \leq d(u, w) + d(w, v), \forall w$ Add WeChat powcoder

<https://powcoder.com>

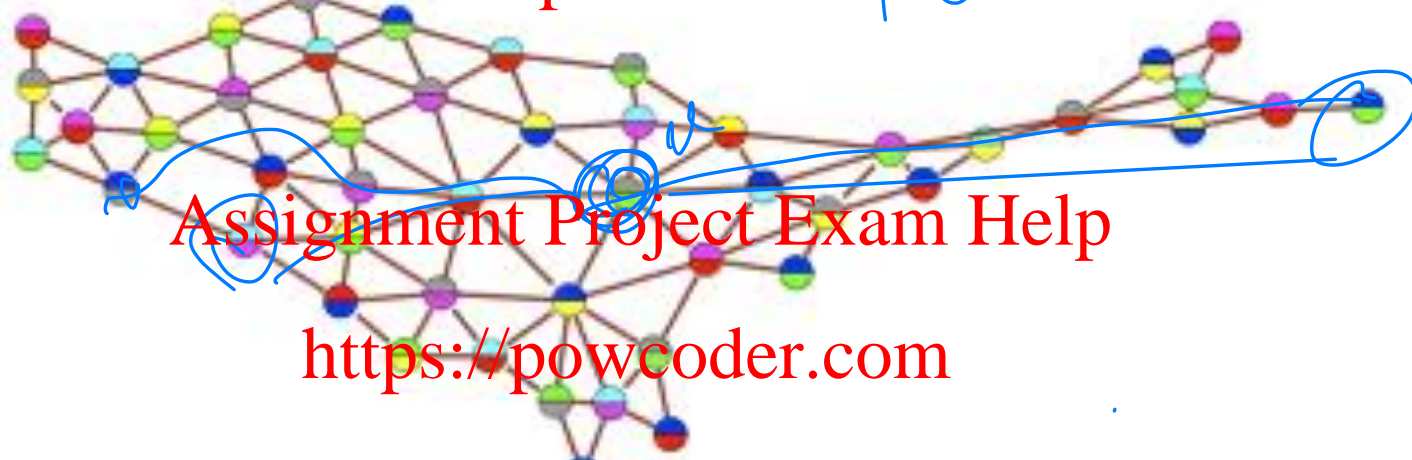

Examples: Graph Eccentricities

Assignment Project Exam Help

- Radius, Diameter

Add WeChat powcoder

$$R = R(u)$$

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

- There is a close relationship between the radius R and the diameter D of a graph

$$- R \leq D \leq 2R.$$

$$R \leq D \leq 2R$$

BFS/DFS

Add WeChat powcoder

<https://powcoder.com>

BFS Spanning Trees

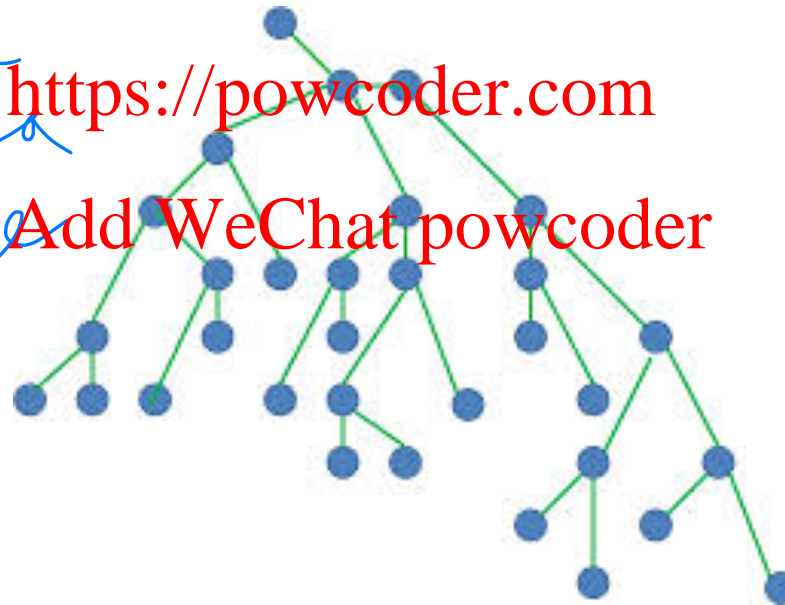

Assignment Project Exam Help

- Traversal of a graph is performed by visiting all of its vertices in some predefined order.
- **Breadth-First-Search Tree.** A breadth-first-search tree T of a graph G is a spanning tree of G such that for every node of G , the tree path is a minimum hop path to the root.

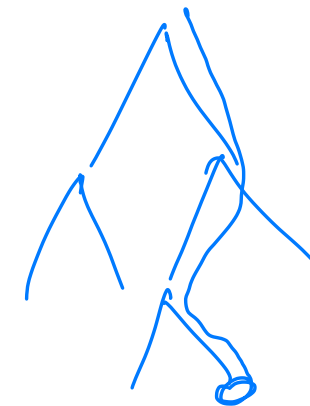

How do we
construct a
BFS tree

<https://powcoder.com>

Add WeChat powcoder

BFS

- Of course a root must be specified!

<https://powcoder.com>

BFS Algorithm^a

Assignment Project Exam Help

- **BFS Algorithm:** Input a graph $G = (V, E)$

Proceed by layers,

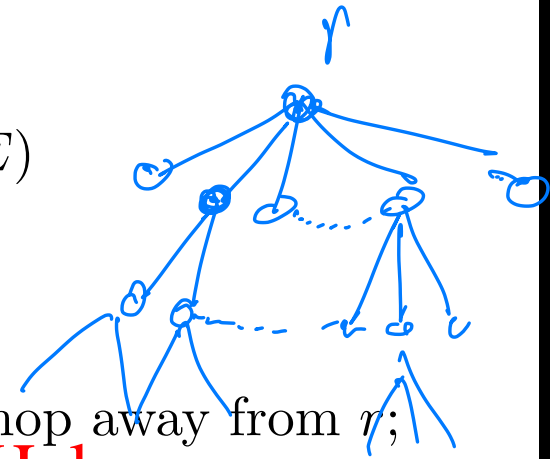

1. mark the root r ;
2. mark all neighbor vertices that are one hop away from r ;
3. mark new vertices that are one hop away from these neighbors (these are two hops away from r);
4. and so on.

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

- It uses a FIFO queue
- It checks whether a vertex has been discovered before enqueueing the vertex rather than delaying this check until the vertex is dequeued from the queue

^aInvented in 1945 by Konrad Zuse

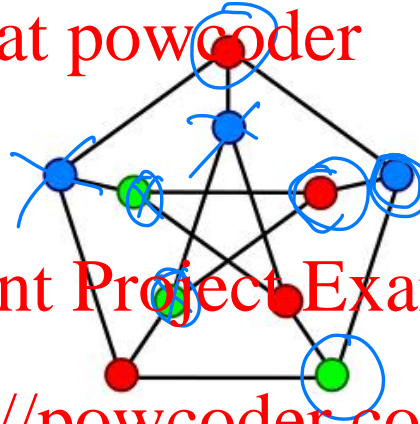

<https://powcoder.com>

BFS Algorithm

Assignment Project Exam Help

- How do you construct a BFS tree from a given graph?

Add WeChat powcoder

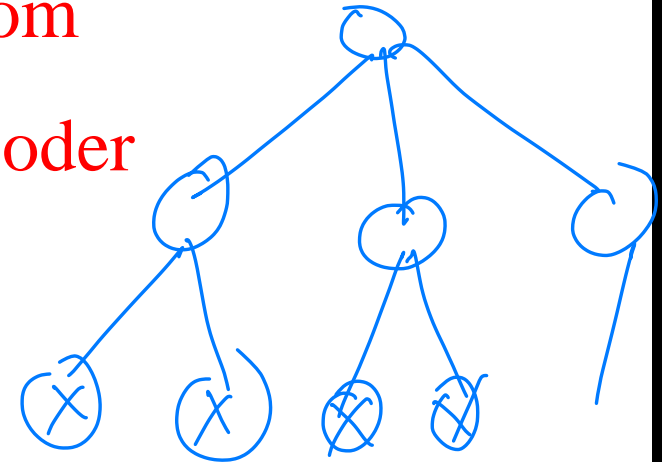

Assignment Project Exam Help

<https://powcoder.com>

- First choose any vertex as a root!

Add WeChat powcoder

<https://powcoder.com>

BFS (Distance Computation (1/2))

Assignment Project Exam Help

- It starts by placing the source node s at distance $d(s) = 0$; the distance of all other nodes starts as $d(i) = \infty$.
- At the k th step (starting at $k = 0$), all nodes i at distance $d(i) = k$ are examined, and any neighbors j with $d(j) = \infty$ (i.e., not yet discovered) have their distance $d(j)$ set to $k + 1$.
- The process halts when step k finds no such neighbors; $d(j)$ is then the length of the shortest path from s to j , or $d(j) = \infty$ if there is no such path.

Add WeChat powcoder

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

if no path exist
it belongs to a
different connected comp.

<https://powcoder.com>

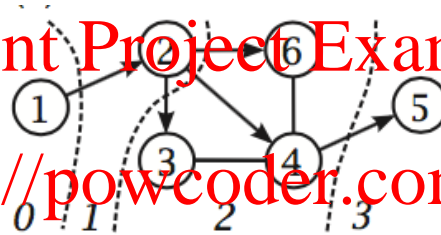

BFS (Distance Computation (2/2))

Assignment Project Exam Help

- BFS is the simplest way to search a graph.
- It is suited only for unweighted graphs: ignores edge weights.
- **Example 1:**

Assignment Project Exam Help

<https://powcoder.com>

- **Example 2:** In a social network, your friends are at level one and your friends of friends are at level two in a BFS starting at your node.

<https://powcoder.com>

What is BFS Tree Used for?

Assignment Project Exam Help

- Finding all nodes within one connected component
 - BFS by itself is not enough: some message passing is needed!

Add WeChat powcoder

forget it ??

- Finding the shortest path between two nodes u and v (with path length measured by number of edges)

Assignment Project Exam Help

- u and v could be the nodes initiating BFS trees, respectively.

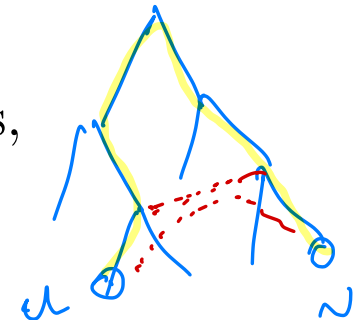

<https://powcoder.com>

$u = \text{root}$

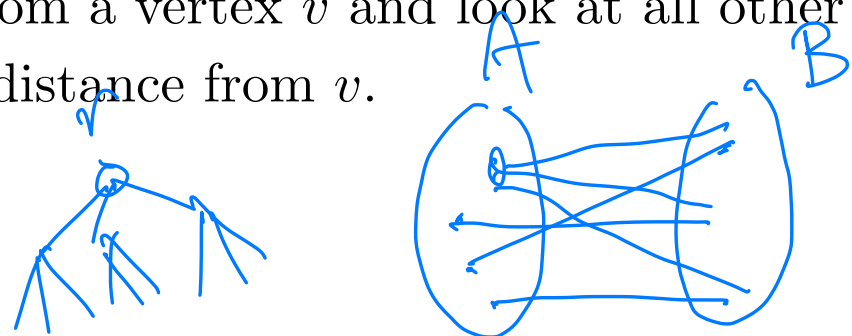

Add WeChat powcoder

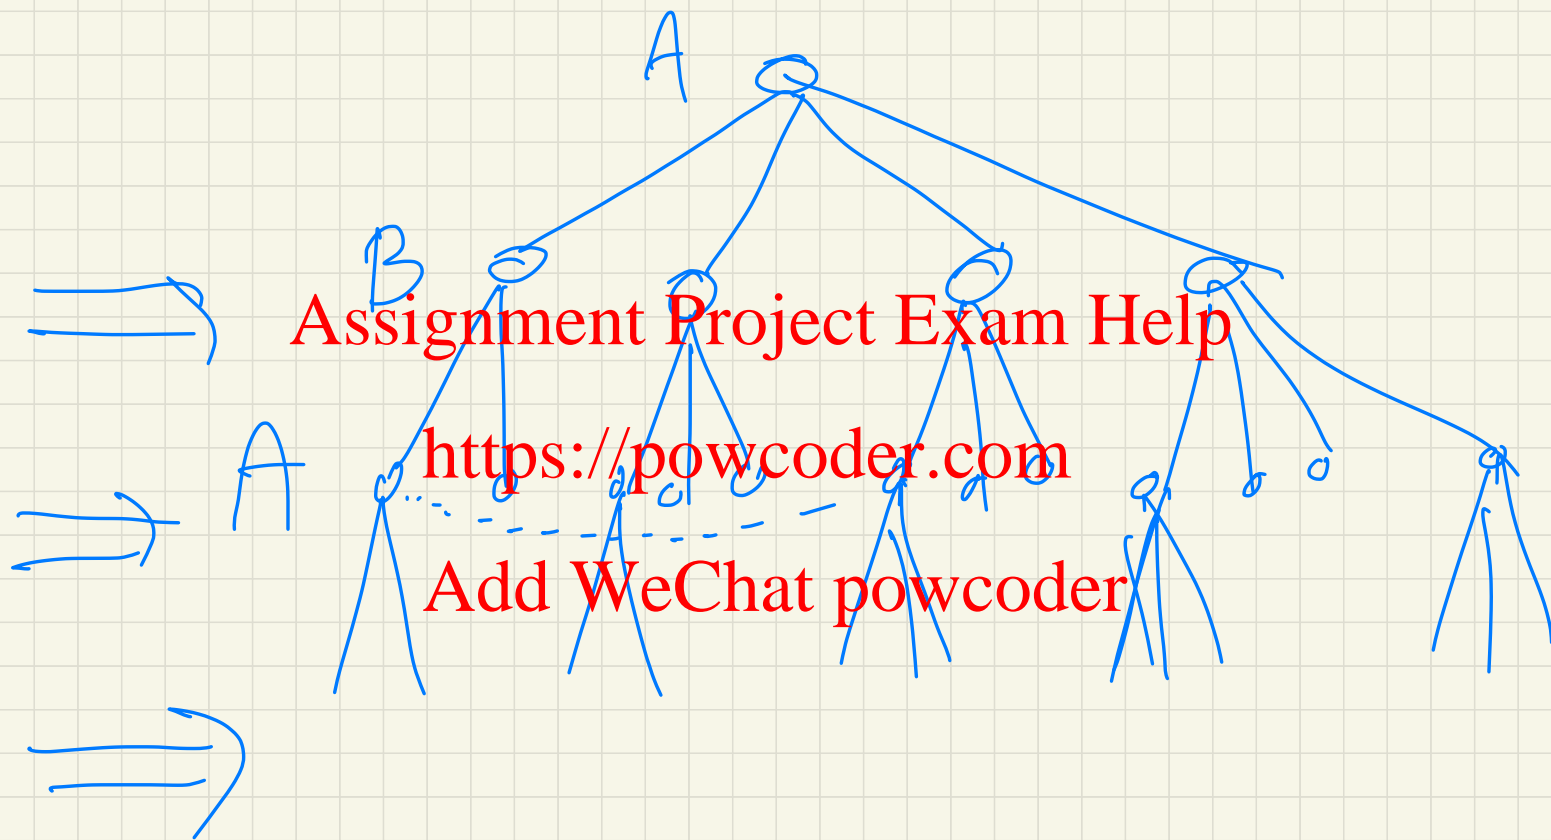

- Testing a graph for bipartiteness

- Construct a BFS tree from a vertex v and look at all other vertices at odd or even distance from v .

- Doing efficient broadcast
 - from any any node.

<https://powcoder.com>

DFS Spanning Trees

Assignment Project Exam Help

- For a rooted spanning tree T of a graph G ,

Add WeChat powcoder

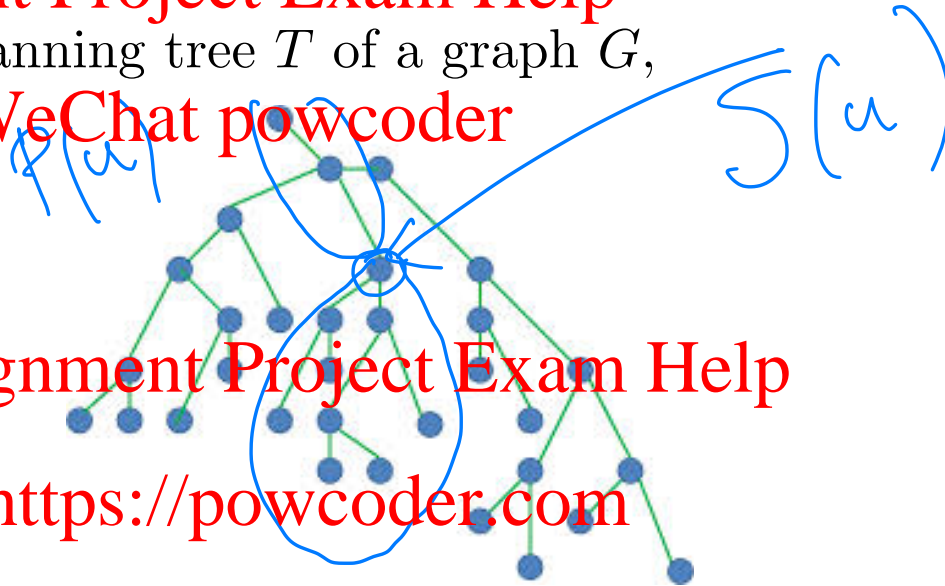

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

let us denote by

- $S(u)$ all the nodes in the subtree of u , and
- $P(u)$ denote all the vertices that exist in a path between u and the root.

<https://powcoder.com>

DFS Spanning Trees

Assignment Project Exam Help

- **DFS Algorithm:** Input a graph $G = (V, E)$

1. Start from a vertex r ;
2. visit all possible vertices as far as you can reach;
3. when all vertices are visited, return to the current parent node.

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

<https://powcoder.com>

DFS (Depth-First Search) (1/2)

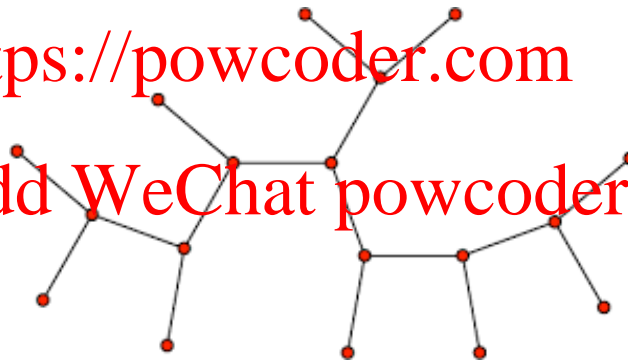

Assignment Project Exam Help

- DFS visits the same nodes as BFS but in a different order.
- If it sees an unvisited node j while examining node i , it fully discovers all unvisited nodes reachable from j and then backtracks to node i to consider the remainder of the nodes adjacent to i .

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

- It is best described recursively.

<https://powcoder.com>

DFS (Depth-First Search) (2/2)

Assignment Project Exam Help

- All nodes start out unvisited.
- DFS(i):

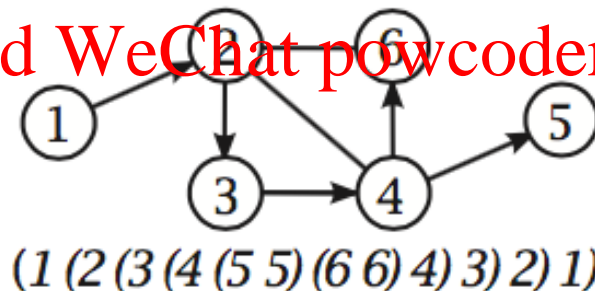

Add WeChat powcoder

1. mark i as visited
2. for all nodes j adjacent to i do:
3. if node j is not visited $DFS(j)$

Assignment Project Exam Help

- Example <https://powcoder.com>

Add WeChat powcoder

<https://powcoder.com>

What is DFS Tree Used for?

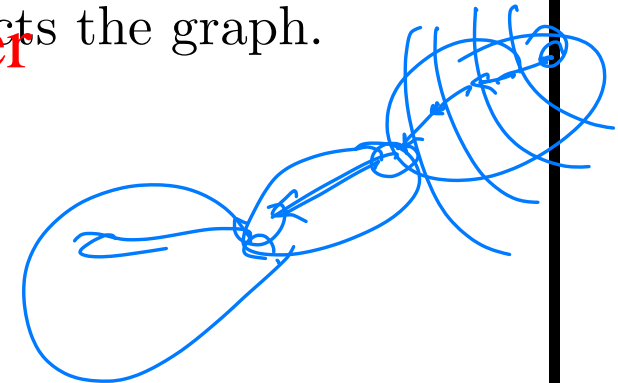

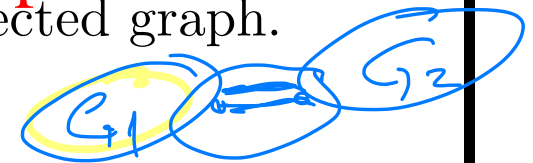

Assignment Project Exam Help

- Finds all of the vertices reachable from a source vertex r in a graph
 - unlike BFS it does not need to search the whole graph.
- Topological sorting.
 - this is because of the way it traverses a directed graph.
- Finding the bridges of a graph.
 - these are edges whose removal disconnects the graph.
- Finding connected components.
 - like BFS.
- Finding strongly connected components.
 - these are maximal “strongly connected components” of a directed graph.

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

<https://powcoder.com>

Lower Bounds

Assignment Project Exam Help

- The message complexity of broadcast in an n node graph is at least $n - 1$.

Add WeChat powcoder

– This is because every node must receive the message.

– Which graphs require $n - 1$ message complexity?

Assignment Project Exam Help

- The source's radius is a lower bound for the time complexity.

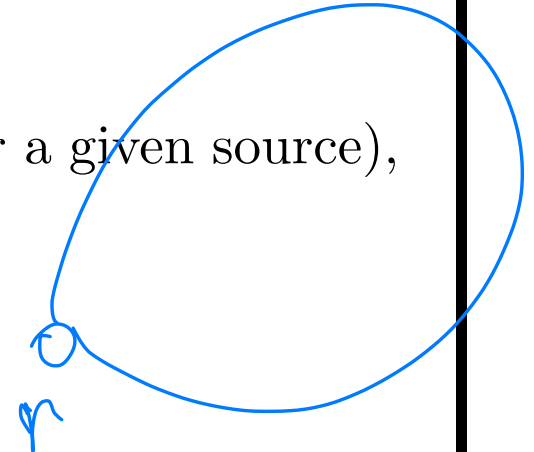

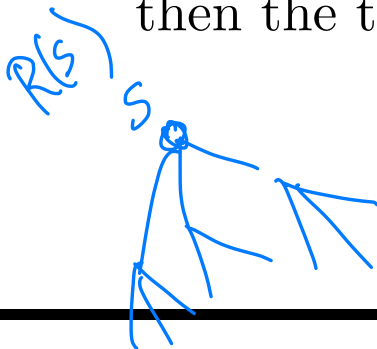

– This is because it needs that many hops from a source.

<https://powcoder.com>

- You can use a pre-computed spanning tree to do broadcast with tight message complexity.

Add WeChat powcoder

- If the spanning tree is a BFS spanning tree (for a given source), then the time complexity is tight as well.

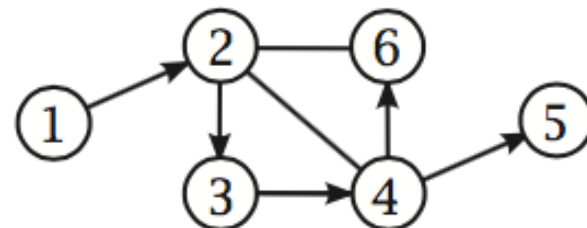

<https://powcoder.com>

More on BFS and DFS

Assignment Project Exam Help

- Both BFS and DFS describe a tree; i is the parent of j if the unvisited node j is discovered while examining node i .
- The DFS tree has a rich set of mathematical properties.
 - For example, if “(i ” is printed at the start of $DFS(i)$ and “ i)” when it finishes (after traversing all its neighbors j), then the result is an expression with properly nested and matching parentheses.
 - The parentheses of two nodes i and j are either nested one within the other, or they are disjoint.

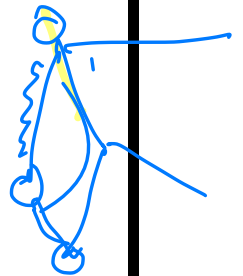

(1 (2 (3 (4 (5 5) (6 6) 4) 3) 2) 1)

<https://powcoder.com>

Impact of Knowledge: Clean Graphs

Assignment Project Exam Help

- If the graph is stored in adjacency list form, both BFS and DFS take an amount of time that is linear in the size of the graph: $O(|V| + |E|)$, where $|V|$ and $|E|$ are the number of nodes and edges, respectively.
- Knowledge can affect the message complexity!
- Call a graph (network) *clean* if the nodes do not know the topology of the graph.
- If the nodes do not know the topology of the graph (i.e., for a clean network) then the number of edges is a lower bound for the broadcast message complexity.
 - If you do not try every edge, you might miss a whole part of the graph behind it.

Flooding

Assignment Project Exam Help

- Used by nodes to identify themselves

[Add WeChat powcoder](#)

- **Flooding Algorithm**

1. The source (root) sends the message to all neighbors.
2. Each other node v upon receiving the message the first time forwards the message to all (other) neighbors.
3. Upon later receiving the message again (over other edges), a node can discard the message.

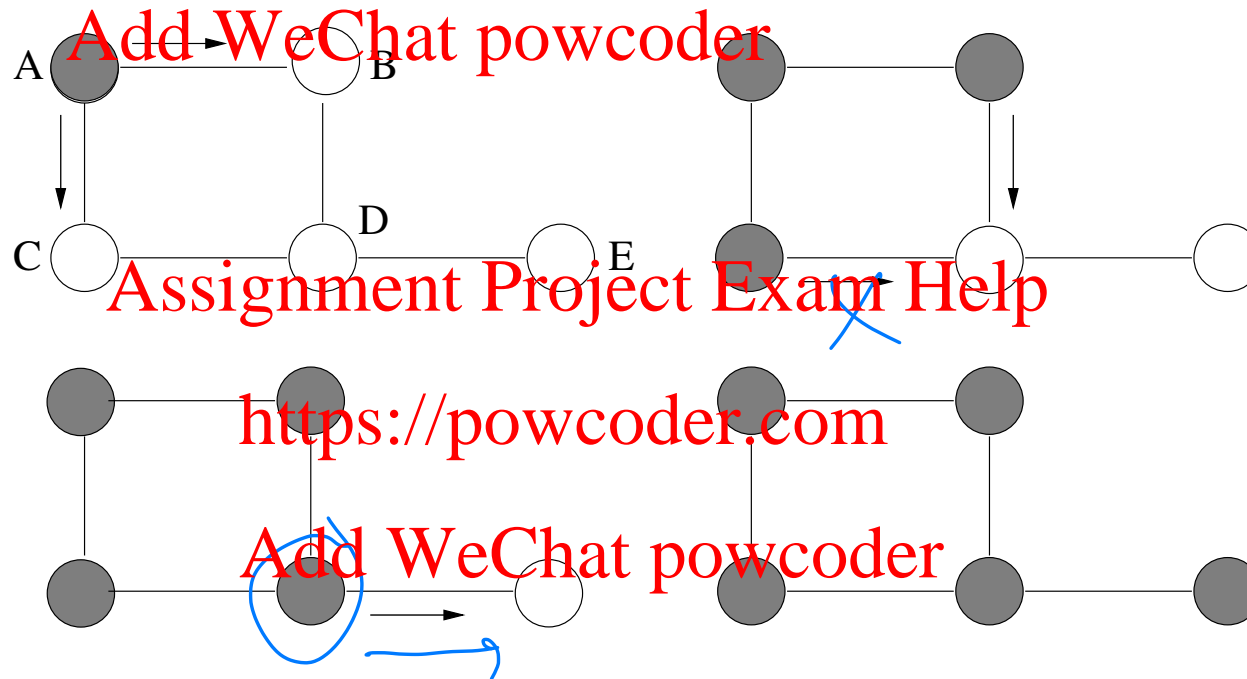

[https://powcoder.com](#)
[Add WeChat powcoder](#)

<https://powcoder.com>

Flooding Example

Assignment Project Exam Help

- Let A be the initiating node:

- Note that node D receives two messages.

<https://powcoder.com>

Flooding and Trees

Assignment Project Exam Help

- If node v receives the message first from node u , then node v calls node u parent.
 - Parent relation defines a spanning tree T (nodes receiving more than one message keep message only from one initiator).
 - If flooding algorithm is executed in a synchronous system, then T is a BFS spanning tree (with respect to the root).
- Let $R(s)$ be the radius of the source s in the network.
 - In asynchronous systems the flooding algorithm terminates after $R(s)$ time units.
 - However, the spanning tree constructed may not be a BFS spanning tree.

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

<https://powcoder.com>

FloodMaxID

Assignment Project Exam Help

- We give a simple algorithm that causes both leaders and non-leaders to identify themselves.
- The algorithm
 - requires that the processes know the diameter of the network;
 - floods the maximum ID throughout the network,
 - * so we call it the FloodMaxID algorithm.
- The algorithm makes leader election possible in a general network.

Add WeChat powcoder

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

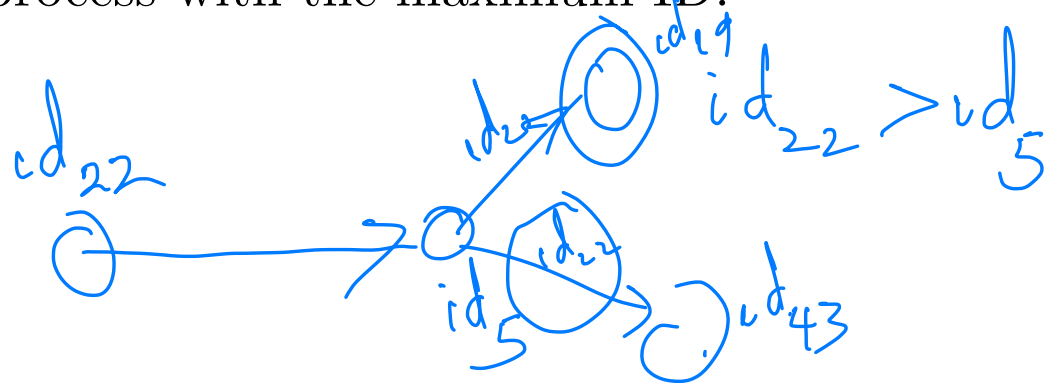

<https://powcoder.com>

Flood MaxID

Assignment Project Exam Help

- FloodMaxID Algorithm**

1. Every process maintains a record of the maximum ID it has seen so far (initially its own).
 2. At each round, each process propagates this maximum on all of its outgoing edges.
 3. After D (diameter) rounds, if the maximum value seen is the process's own ID, the process elects itself the leader; otherwise, it is a non-leader.
- FloodMax elects the process with the maximum ID.

<https://powcoder.com>

Analysis of FloodMax

Assignment Project Exam Help

- Define i_{\max} to be the index of the process with the maximum ID, and u_{\max} to be that user ID.

Add WeChat powcoder

- **Theorem 3** *In the FloodMax algorithm, process i_{\max} outputs leader and each other process outputs non-leader, within diameter rounds.*

Assignment Project Exam Help

- **Main Claim** *After diameter rounds,*
 - $status_{i_{\max}} = \text{leader}$ and
 - $status_j = \text{non-leader}$, for every $j \neq i_{\max}$.

<https://powcoder.com>

Add WeChat powcoder

- The key to the proof of this Claim is the fact that
 - after r rounds, the maximum ID has reached every process that is within distance r of i_{\max} , as measured along directed paths in G .

in diameter number of steps you know who the leader is if i_{\max}

Assignment Project Exam Help

<https://powcoder.com>

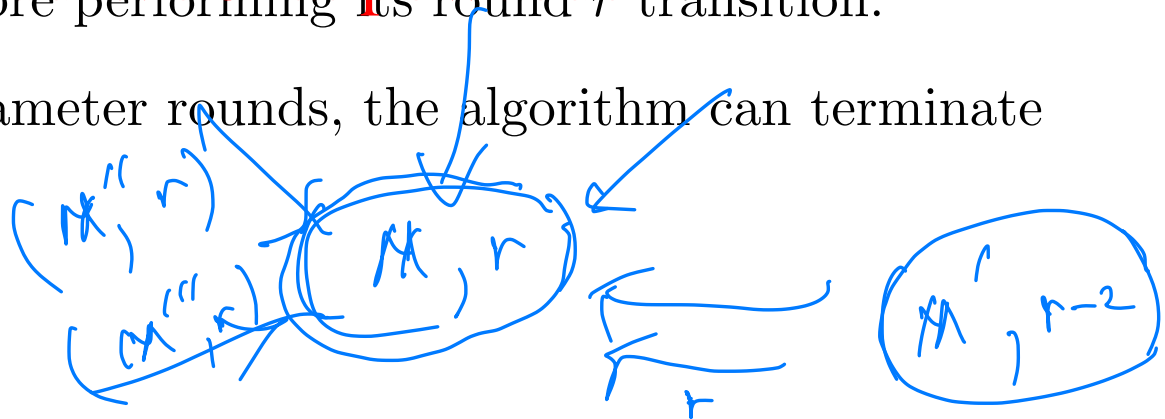

Add WeChat powcoder

<https://powcoder.com>

FloodMax

Assignment Project Exam Help

- The FloodMax algorithm does not extend directly to the asynchronous setting, because there are no rounds in the asynchronous model.
- However, it is possible to simulate the rounds asynchronously.
 - We simply require each process that sends a round r message to tag that message with its round number r .
 - The recipient waits to receive round r messages from all its neighbors before performing its round r transition.
- By simulating diameter rounds, the algorithm can terminate correctly.

In a way, we make the
algorithm "message driven"
Assignment Project Exam Help

I must

Echo Algorithm

Echo Algorithm

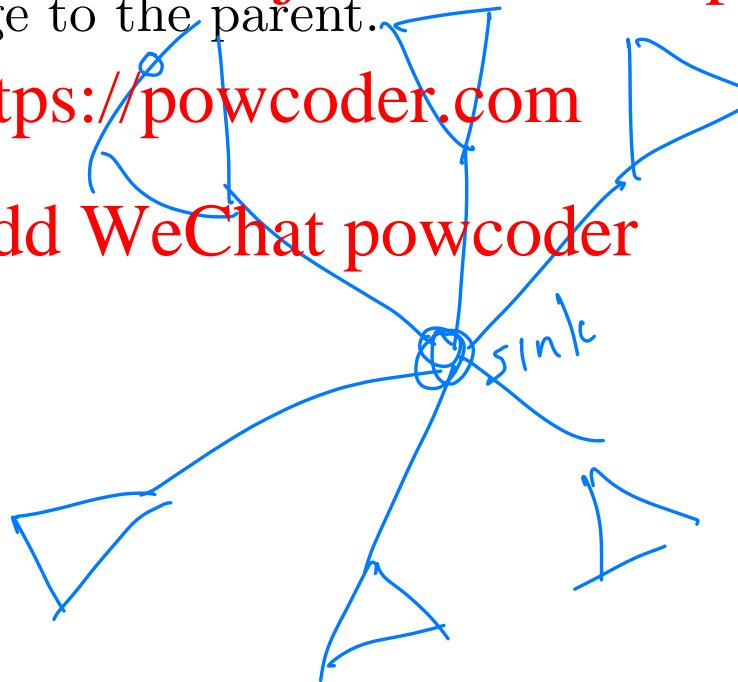

Add WeChat powcoder

- **Requirement:** This algorithm is initiated at the leaves.
 1. A leaf sends a message to its parent.
 2. If an inner node has received a message from each child, it sends a message to the parent.

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Broadcast
Followed
by
Echo

<https://powcoder.com>

Complexity Issues: Broadcast and Convergecast (1/2)

Assignment Project Exam Help

- The echo algorithm is paired with the flooding algorithm, which is used to let the leaves know that they should start the echo process; this is known as flooding/echo.
- One can use convergecast for termination detection.
 - If a root wants to know whether all nodes in the system have finished some task, it initiates a flooding/echo;
 - * the message in the echo algorithm then means “This subtree has finished the task.”
- Message complexity of the echo algorithm is $n - 1$,
 - but together with flooding it is $O(m)$, where $m = |E|$ is the number of edges in the graph.

Complexity Issues: Broadcast and Convergecast (2/2)

Assignment Project Exam Help

- The time complexity of the echo algorithm is determined by the depth of the spanning tree (i.e., the radius of the root within the tree) generated by the flooding algorithm.
- The flooding/echo algorithm can do much more than collecting acknowledgements from subtrees.
 - For instance, one can use it to compute the number of nodes in the system, or the maximum ID (for leader election), or the sum of all values stored in the system.
- By combining results one can compute even fancier aggregations, e.g., with the number of nodes and the sum one can compute the average. With the average one can compute the standard deviation. And so on . . .

Application to Leader Election

Assignment Project Exam Help

- Asynchronous broadcast and convergecast can be used to solve the leader election problem in arbitrary graphs
 - without any distinguished source node and
 - without the processes having any knowledge of the number of nodes or the diameter of the network.
- The processes need to have unique IDs.

Basic Leader Election Algorithm

Assignment Project Exam Help

- Every node can initiate
 - first a broadcast, and
 - next a convergecast

Add WeChat powcoder

in order to discover the maximum user ID in the network.

Assignment Project Exam Help

- The node that finds that the maximum is equal to its own ID elects itself as leader.
- This algorithm uses $O(n|E|)$ messages.

Construction of BFS

Assignment Project Exam Help

- How do we perform breadth-first search (BFS) in a network based on an arbitrary strongly connected directed graph having a distinguished source node?
- We consider how to establish a breadth-first spanning tree for the (di)-graph.
- Motivation for constructing such a tree comes from the desire to have a convenient structure to use as a basis for broadcast communication.
- The BFS tree minimizes the maximum communication time from the process at the distinguished node to all other processes in the network
 - To do this run BFS from each node of the graph and compare values obtained at each node.

<https://powcoder.com>

Construction of BFS Assignment Project Exam Help

- We suppose that the network is strongly connected and that there is a distinguished source node i_0 .
Add WeChat powcoder
- The algorithm is supposed to output the structure of a breadth-first directed spanning tree of the network graph, rooted at i_0 .
Assignment Project Exam Help
- The output should appear in a distributed fashion: each process other than i_0 should have a parent component that gets set to indicate the node that is its parent in the tree.
<https://powcoder.com>
Add WeChat powcoder
- As usual, processes only communicate over directed edges.
- Processes are assumed to have user IDs but to have no knowledge of the size or diameter of the network.

<https://powcoder.com>

SynchBFS

Assignment Project Exam Help

- The basic idea for this algorithm is the same as for the standard sequential breadth-first search algorithm.

Add WeChat powcoder

- **SynchBFS Algorithm**

1. At any point during execution, there is some set of processes that is *marked*: initially just i_0 .
2. Process i_0 sends out a search message at round 1, to all of its outgoing neighbors.
3. At any round, if an unmarked process receives a search message, it marks itself and chooses one of the processes from which the search has arrived as its parent.
4. At the first round after a process gets marked, it sends a search message to all of its outgoing neighbors.

Analysis of SynchBFS

Assignment Project Exam Help

- We can prove the invariant that
 - after r rounds, every process at distance d from i_0 in the graph, $1 \leq d \leq r$, has its parent pointer defined; moreover, each such pointer points to a node at distance $d - 1$ from i_0 .

Add WeChat powcoder

This invariant can, as usual, be proved by induction on the number of rounds.

Assignment Project Exam Help

<https://powcoder.com>

- The time complexity is at most diameter rounds.
- The number of messages is just $|E|$
 - a search message is transmitted exactly once on each directed edge.

Message Broadcast: Piggybacking

Assignment Project Exam Help

- The SynchBFS algorithm can easily be augmented to implement message broadcast.
- If a process has a message M that it wants to communicate to all of the processes in the network,
 - it can simply initiate an execution of SynchBFS with itself as the root, piggybacking message M on the search message it sends in round 1.
- Other processes continue to piggyback M on all their search messages as well.
 - Since the tree eventually spans all the nodes, message M is eventually delivered to all the processes.

Global Computation

Assignment Project Exam Help

- This means
 - Collection of information from throughout the network or,
 - more generally, the computation of a function based on distributed inputs.
- For example,
 - consider the problem in which each process has a nonnegative integer input value and we want to find the sum of all the inputs in the network.
 - Using a BFS tree, this can be done easily (and efficiently) as follows.

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

<https://powcoder.com>

Global Computation

Assignment Project Exam Help

- Starting from the leaves, “fan in” the results in a convergecast procedure, as follows.

Add WeChat powcoder

1. Each leaf sends its value to its parent;
2. each parent waits until it gets the values from all its children, adds them to its own input value, and then sends the sum to its own parent.

Assignment Project Exam Help

<https://powcoder.com>

- The sum calculated by the root of the BFS tree is the final answer.

Add WeChat powcoder

<https://powcoder.com>

Electing a Leader

Assignment Project Exam Help

- Using SynchBFS, an algorithm can be designed to elect a leader in a network with IDs, even when the processes have no knowledge of n or diameter.
<https://powcoder.com>
Add WeChat powcoder
- 1. Namely, all the processes can initiate breadth-first searches in parallel.
Assignment Project Exam Help
- 2. Each process i uses the tree thereby constructed and the global computation procedure just described to determine the maximum ID of any process in the network.
<https://powcoder.com>
Add WeChat powcoder
- 3. The process with the maximum ID then declares itself to be the leader, and all others announce that they are not the leader.
- If the graph is undirected, the time is $O(\text{diameter})$ and the number of messages is $O(n|E|)$.

<https://powcoder.com>

Computing the Diameter

Assignment Project Exam Help

- The diameter of the network can be computed by having all processes initiate breadth-first searches in parallel.

Add WeChat powcoder

1. Each process i uses the tree thereby constructed to determine $\max\text{-dist}$, defined to be the maximum distance from i to any other process in the network.

Assignment Project Exam Help

2. Each process i then reuses its breadth-first tree for a global computation to discover the maximum of the $\max\text{-dist}$ values.

<https://powcoder.com>
Add WeChat powcoder

- If the graph is undirected, the time is $O(\text{diam})$ and the number of messages is $O(n|E|)$, where diam is the diameter of the graph.
- The diameter thus computed could be used, for example, in the leader-election algorithm FloodMax.

Exercises^a

Assignment Project Exam Help

1. Explain why every tree is a bipartite graph.
2. Let T be a graph with n vertices. Then the following statements are equivalent.
 - (a) T is connected and has no cycles.
 - (b) T has $n - 1$ edges and has no cycles.
 - (c) T is connected and has $n - 1$ edges.
 - (d) T is connected and the removal of any edge disconnects T .
 - (e) Any two vertices of T are connected by exactly one path.
 - (f) T contains no cycles, but the addition of any new edge creates a cycle.
3. Give an algorithm to compute the diameter and radius of a tree.
4. Determine the size of a message which propagates for r hops in
